Spring Framework MVC Spring Security Java 1.8 JUnit 5 11 Mayo 2023

··· 1. SELECT

Selecciona las columnas requeridas para presentar la información solicitada.

```
* @return ModelAndView objeto que representa la vista de la lista de usuarios
@GetMapping("/listarUsuarios")
public ModelAndView listaUsuarios() {
   List<Users> users = userDAO.obtenerTodos();
   final String GETONEWITHROLES = "SELECT users.username, COUNT(authorities.authority) AS num_roles FROM users"
                                    + " INNER JOIN authorities ON users.username = authorities.username"
                                    + " ORDER BY users.username";
   List<Map<String, Object>> resumenUsuarios = jdbcTemplate.gueryForList(GETONEWITHROLES);
   ModelAndView mav = new ModelAndView();
   mav.addObject("datos", users);
   mav.addObject("resumen", resumenUsuarios);
   mav.setViewName("users/listUsersForm");
   return may;
```

∷ż. JOIN

Utiliza JOIN para relacionar la información de distintas tablas

```
* @return ModelAndView objeto que representa la vista de la lista de usuarios
@GetMapping("/listarUsuarios")
public ModelAndView listaUsuarios() {
   List<Users> users = userDAO.obtenerTodos();
   final String GETONEWITHROLES = "SELECT users.username, COUNT(authorities.authority) AS num_roles FROM users"
                                    + " INNER JOIN authorities ON users.username = authorities.username"
                                    + " ORDER BY users.username";
   List<Map<String, Object>> resumenUsuarios = idbcTemplate.gueryForList(GETONEWITHROLES);
   ModelAndView mav = new ModelAndView();
   mav.addObject("datos", users);
   mav.addObject("resumen", resumenUsuarios);
   mav.setViewName("users/listUsersForm");
   return may;
```

3. WHERE

Utiliza WHERE para filtrar información requerida

```
@Repositoru
public class UserDAOImpl implements GenericDAO<Users> +
   @Autowired
   private JdbcTemplate jdbcTemplate;
   final String GETONEFORID = "SELECT * FROM users INNER JOIN authorities ON users.username = authorities.username";
   final String GETONEFORNAME = "SELECT * FROM users WHERE username = ?:";
   final String GETALL = "SELECT * FROM users order by username";
   final String INSERT = "INSERT INTO users (username, password, enabled) VALUES (?, ?, ?)";
   final String UPDATE = "UPDATE users SET password = ?, enabled = ? WHERE username = ?";
   final String DELETEFORUSERNAME = "DELETE FROM users WHERE username = ?":
    * @param nombre String
   public Users buscarPorNombre(String nombre) {
      Users user = jdbcTemplate.queryForObject(GETONEFORNAME, new Object[]{nombre}, new UserRowMapper());
       return user:
```

4. ORDER BY

Utiliza cláusulas de ordenamiento para presentar la información

```
* @return ModelAndView objeto que representa la vista de la lista de usuarios
@GetMapping("/listarUsuarios")
public ModelAndView listaUsuarios() {
   List<Users> users = userDAO.obtenerTodos();
   final String GETONEWITHROLES = "SELECT users.username, COUNT(authorities.authority) AS num_roles FROM users"
                                    + " INNER JOIN authorities ON users.username = authorities.username"
                                    + " ORDER BY users.username";
   List<Map<String, Object>> resumenUsuarios = jdbcTemplate.gueryForList(GETONEWITHROLES);
   ModelAndView mav = new ModelAndView();
   mav.addObject("datos", users);
   mav.addObject("resumen", resumenUsuarios);
   mav.setViewName("users/listUsersForm");
   return may;
```

5. GROUP BY

Utiliza cláusulas de agrupación de información para obtener datos agregados

```
* @return ModelAndView objeto que representa la vista de la lista de usuarios
@GetMapping("/listarUsuarios")
public ModelAndView listaUsuarios() {
   List<Users> users = userDAO.obtenerTodos();
   final String GETONEWITHROLES = "SELECT users.username, COUNT(authorities.authority) AS num_roles FROM users"
                                    + " INNER JOIN authorities ON users.username = authorities.username"
                                    + " ORDER BY users.username";
   List<Map<String, Object>> resumenUsuarios = idbcTemplate.gueryForList(GETONEWITHROLES);
   ModelAndView mav = new ModelAndView();
   mav.addObject("datos", users);
   mav.addObject("resumen", resumenUsuarios);
   mav.setViewName("users/listUsersForm");
   return may;
```

6. USO DEL LENGUAJE

.

Utilización general del lenguaje, sintaxis, selección de tipos de datos, sentencias lógicas, expresiones, operaciones, comparaciones

```
    UsersController.java 
    X

         @PostMopping("/actualizarUsuario")
         public ModelAndView actualizarUsuario(@ModelAttribute("userForm") Users userForm,
                                              @RequestParam(value = "rolesAsignados", required = false) List<String> rolesAsignados,
                                             BindingResult result) {
             ModelAndView may = new ModelAndView();
             authoritiesDAO.eliminarRolesPorUsername(userForm.getUsername());
             List<Authorities> listaRoles = new ArrayList ();
             if(rolesAsignados ≠ null) {
                 for(String rol: rolesAsignados) {
                     System.out.println("[ROL] " + rol);
                     Authorities authorities = new Authorities();
                     authorities.setUsername(userForm.getUsername());
                     authorities.setAuthority(rol);
                      authoritiesDAO.insertar(authorities);
                     listaRoles.add(authorities);
```

.

...7. SENTENCIAS REPETITIVAS

Utilización de sentencias repetitivas

.

.

```
    UsersController.java 
    X

         @PostMopping("/actualizarUsuario")
         public ModelAndView actualizarUsuario(@ModelAttribute("userForm") Users userForm,
                                              @RequestParam(value = "rolesAsignados", required = false) List<String> rolesAsignados,
                                             BindingResult result) {
             ModelAndView may = new ModelAndView();
             authoritiesDAO.eliminarRolesPorUsername(userForm.getUsername());
             List<Authorities> listaRoles = new ArrayList ();
             if(rolesAsignados ≠ null) {
                 for(String rol: rolesAsignados) {
                     System.out.println("[ROL] " + rol);
                     Authorities authorities = new Authorities();
                     authorities.setUsername(userForm.getUsername());
                     authorities.setAuthority(rol);
                     authoritiesDAO.insertar(authorities);
                     listaRoles.add(authorities);
                                                                                                        . . . . .
```

8. Uso de clases, encapsulamiento, responsabilidad única.

Utilización de clases, encapsulamiento y responsabilidad única

.

```
@NotBlank(message = "Campo requerido")
@NotBlank(message = "Campo requerido")
private List<Authorities> authorities:
 public Users(String username, String password, int enabled, List<Authorities> authorities) {
public void setUsername(String username) {
public String getPassword() {
public void setPassword(String password) {
```

.

encapsulamiento, responsabilidad única.

.

Se utilizan
correctamente
interfaces o
relaciones de
herencia para hacer
polimorfismo donde
fuese
necesario

```
oublic class UserDAOImpl implements GenericDAO<Users> {
  private JdbcTemplate jdbcTemplate;
  final String GETONEFORID = "SELECT * FROM users INNER JOIN authorities ON users.username = authorities.username";
  final String GETONEFORNAME = "SELECT * FROM users WHERE username = ?;";
  final String GETALL = "SELECT * FROM users order by username";
  final String UPDATE = "UPDATE users SET password = ?, enabled = ? WHERE username = ?";
  final String DELETEFORUSERNAME = "DELETE FROM users WHERE username = ?";
  public Users buscarPorId(int id) {
      Users user = jdbcTemplate.queryForObject(GETONEFORID, new Object[]{id}, new UserRowMapper());
      return user;
```

10. Convenciones

.

.

.

.

Convenciones y estilos de programación.

```
authoritiesDAO.eliminarRolesPorUsername(userForm.getUsername());
List<Authorities> listaRoles = new ArrayList ◇();
   for(String rol: rolesAsignados) {
       authorities.setUsername(userForm.getUsername());
       authorities.setAuthority(rol);
       authoritiesDAO.insertar(authorities);
       listaRoles.add(authorities);
                                                                                     . . . . .
                                                                                      . . . . . .
                                                                                     . . . . .
                                                                                     -----
                                                                                     . . . . .
                                                                                     . . . . .
```
